SUMMARY

PhD candidate in Industrial and Systems Engineering specializing in machine learning, causal inference, and multimodal human behavior modeling. Experienced in developing end-to-end pipelines and evaluation frameworks that translate complex data into actionable, user-centered insights. Skilled in applying AI/ML methods, statistical analysis, and experimental design to real-world problems, with publications in human factors and ergonomics. Seeking a research or data science internship to develop adaptive, data-driven solutions.

EDUCATION

University of Washington, Seattle <i>Ph.D in Industrial and Systems Engineering, Dean's Fellowship Recipient</i>	Sep 2025 – Jun 2029 (Expected)
Virginia Tech, Blacksburg <i>M.S in Industrial and Systems Engineering (Thesis Track), GPA 3.89/4.0</i>	Aug 2023 – May 2025
Yonsei University, Seoul <i>B.S in Industrial Engineering, GPA 3.52/4.0, Student Council President</i>	Mar 2017 – Feb 2023

EXPERIENCE

Graduate Research Assistant, Human Automation Systems Lab, University of Washington	Sep 2025 – Present
- Built ML models to assess vigilance using multimodal physiological time-series data (ECG, eye tracking, BVP, EDA, HR); developed preprocessing pipelines for heterogeneous sensor streams using Python and scikit-learn - Engineered 30+ physiological and contextual features across 10,000+ observations per participant; improved predictive performance by ~20% through feature engineering and model refinement	
Graduate Research Assistant, Occupational Ergonomics and Biomechanics Lab, Virginia Tech	Aug 2023 – May 2025
- Developed end-to-end data pipeline to collect, preprocess, and analyze multimodal datasets (EMG, EEG, IMU, motion capture, behavioral logs) across longitudinal studies (3 weeks/participant; 100,000+ records) - Designed and validated zero-shot NLP classifier for unstructured work-context text; built time-series forecasting models incorporating contextual variables; improved prediction accuracy through data segmentation and clustering	

KEY PROJECTS

Human Vigilance Modeling with Causal Inference <i>University of Washington</i>
Built predictive models of moment-to-moment alertness using multimodal physiological and contextual data (ECG, BVP, EDA, HR, eye tracking), engineering 30+ features across 10,000+ observations per participant. Improved model performance by 20% through feature engineering and hyperparameter tuning. Applied causal inference frameworks to disentangle key drivers of performance variability.
Driver Response Modeling for V2X Pedestrian Alerts <i>City of Bellevue / University of Washington</i>
Designed and conducted a field study collecting physiological sensor data (E4 Empatica: EDA, BVP, HR), NASA-TLX workload ratings, and vehicle kinematics to model driver responses to V2X crosswalk pedestrian alerts.
NudgeWatch — Adaptive Sit-Stand Nudging System <i>University of Washington</i>
Built a full-stack Apple Watch intervention system (Swift, Python/FastAPI) with real-time posture detection and an active-learning nudge engine. Ran a 5-participant pilot combining sensor logs with experience-sampling feedback; found the adaptive loop measurably improved outcomes, though adaptation was rarely correctly perceived by users.
Context-Aware Sit-Stand Intervention <i>Virginia Tech</i>
Analyzed longitudinal behavioral datasets (3 weeks/participant; 100,000+ records) to forecast posture transitions during computer work, improving prediction accuracy through time-series modeling and behavior clustering.

SKILLS

Programming: Python, SQL (MySQL), Swift (WatchOS)
ML/DL: Scikit-learn, TensorFlow, PyTorch
Data Analysis: Statistical modeling, Causal inference, Experimental design, Time-series analysis
Communication: Technical reporting, Cross-functional collaboration

AWARDS

Dean's Fellowship, College of Engineering — University of Washington	2025–2029
Social-Innovation Capability Video Contest, 2nd Place (Data Mining) — Yonsei University	2022
Merit-based Scholarship (Academic Excellence) — Yonsei University	2021
